

Role of a Molecular Informatics Platform to Connect Risk Assessments within Cosmetics Industry

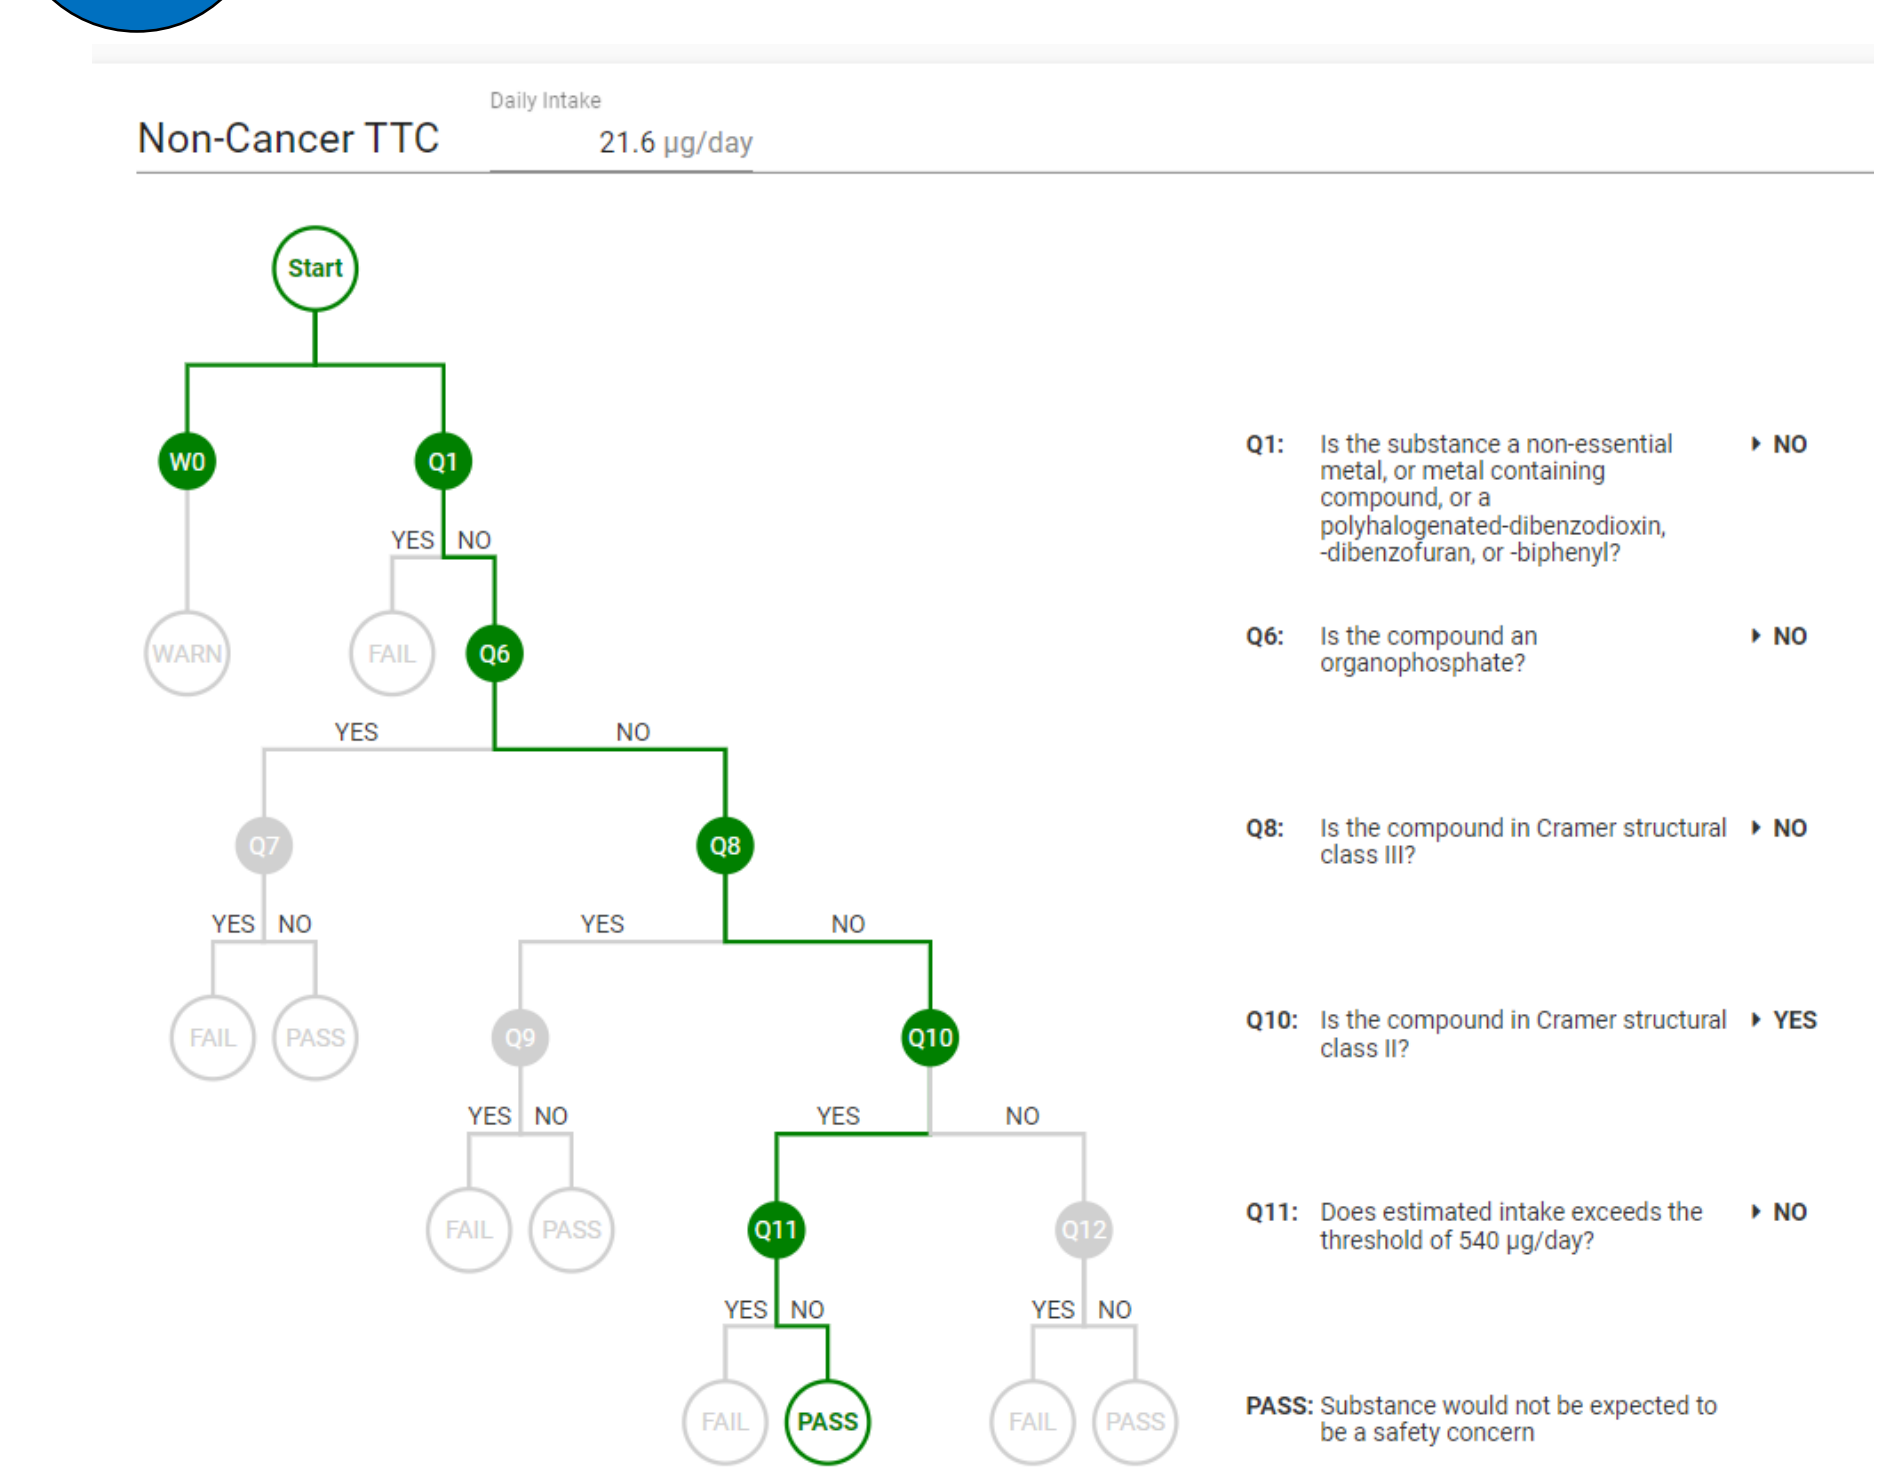

1 OBJECTIVES

- A key objective of the Systemic Toxicity Task Force in Cosmetic Europe's Long-Range Science Strategy (LRSS) program is to explore new approach methodologies (NAM) for the safety assessment of cosmetic ingredients.
- Task force has adopted the ChemTunes.ToxGPS® cheminformatics platform, allowing CE members to expand functionalities and integrate data and knowledge. This poster is focused on the Tier 0 process.
- Case study approach is being used to guide design and development. A detailed example is presented here for 1-Octene-3-ol (amylvinyl carbinol) applying TTC and read-across in the assessment of genetic toxicity.

2 USE CASE ILLUSTRATION

3 THRESHOLD OF TOXICOLOGICAL CONCERN

TTC Process Tree

- 1-Octene-3-ol is not one of the COC structures.
- 1-Octene-3-ol is not genotoxic (confirmed through RAX)
- Cramer Class II (Toxtree v3.1.0 build 1851, implemented in ChemTunes.ToxGPS)
- Expected daily intake (EDI) of 1-Octene-3-ol (0.216 µg/day) is much lower than the 540 µg/day threshold.
- The tree indicates a safe exit even when 21.6 µg/day (100x EDI) is entered.

5 EVIDENCE USED IN READ-ACROSS (RAX)

- Analogue Quality (AQ)**
 - $AQ = (Structure_{sim} \times Property_{sim} \times Assay_{sim})^{1/3}$
 - Structure fingerprints
 - Mechanistically-relevant structure categories
 - Property-based similarity
 - Assay vector-based similarity
- Study Data Quality (SQ)**
 - Based on concept similar to Klimisch score
 - SQ values range from 0 (poor) to 1 (high)

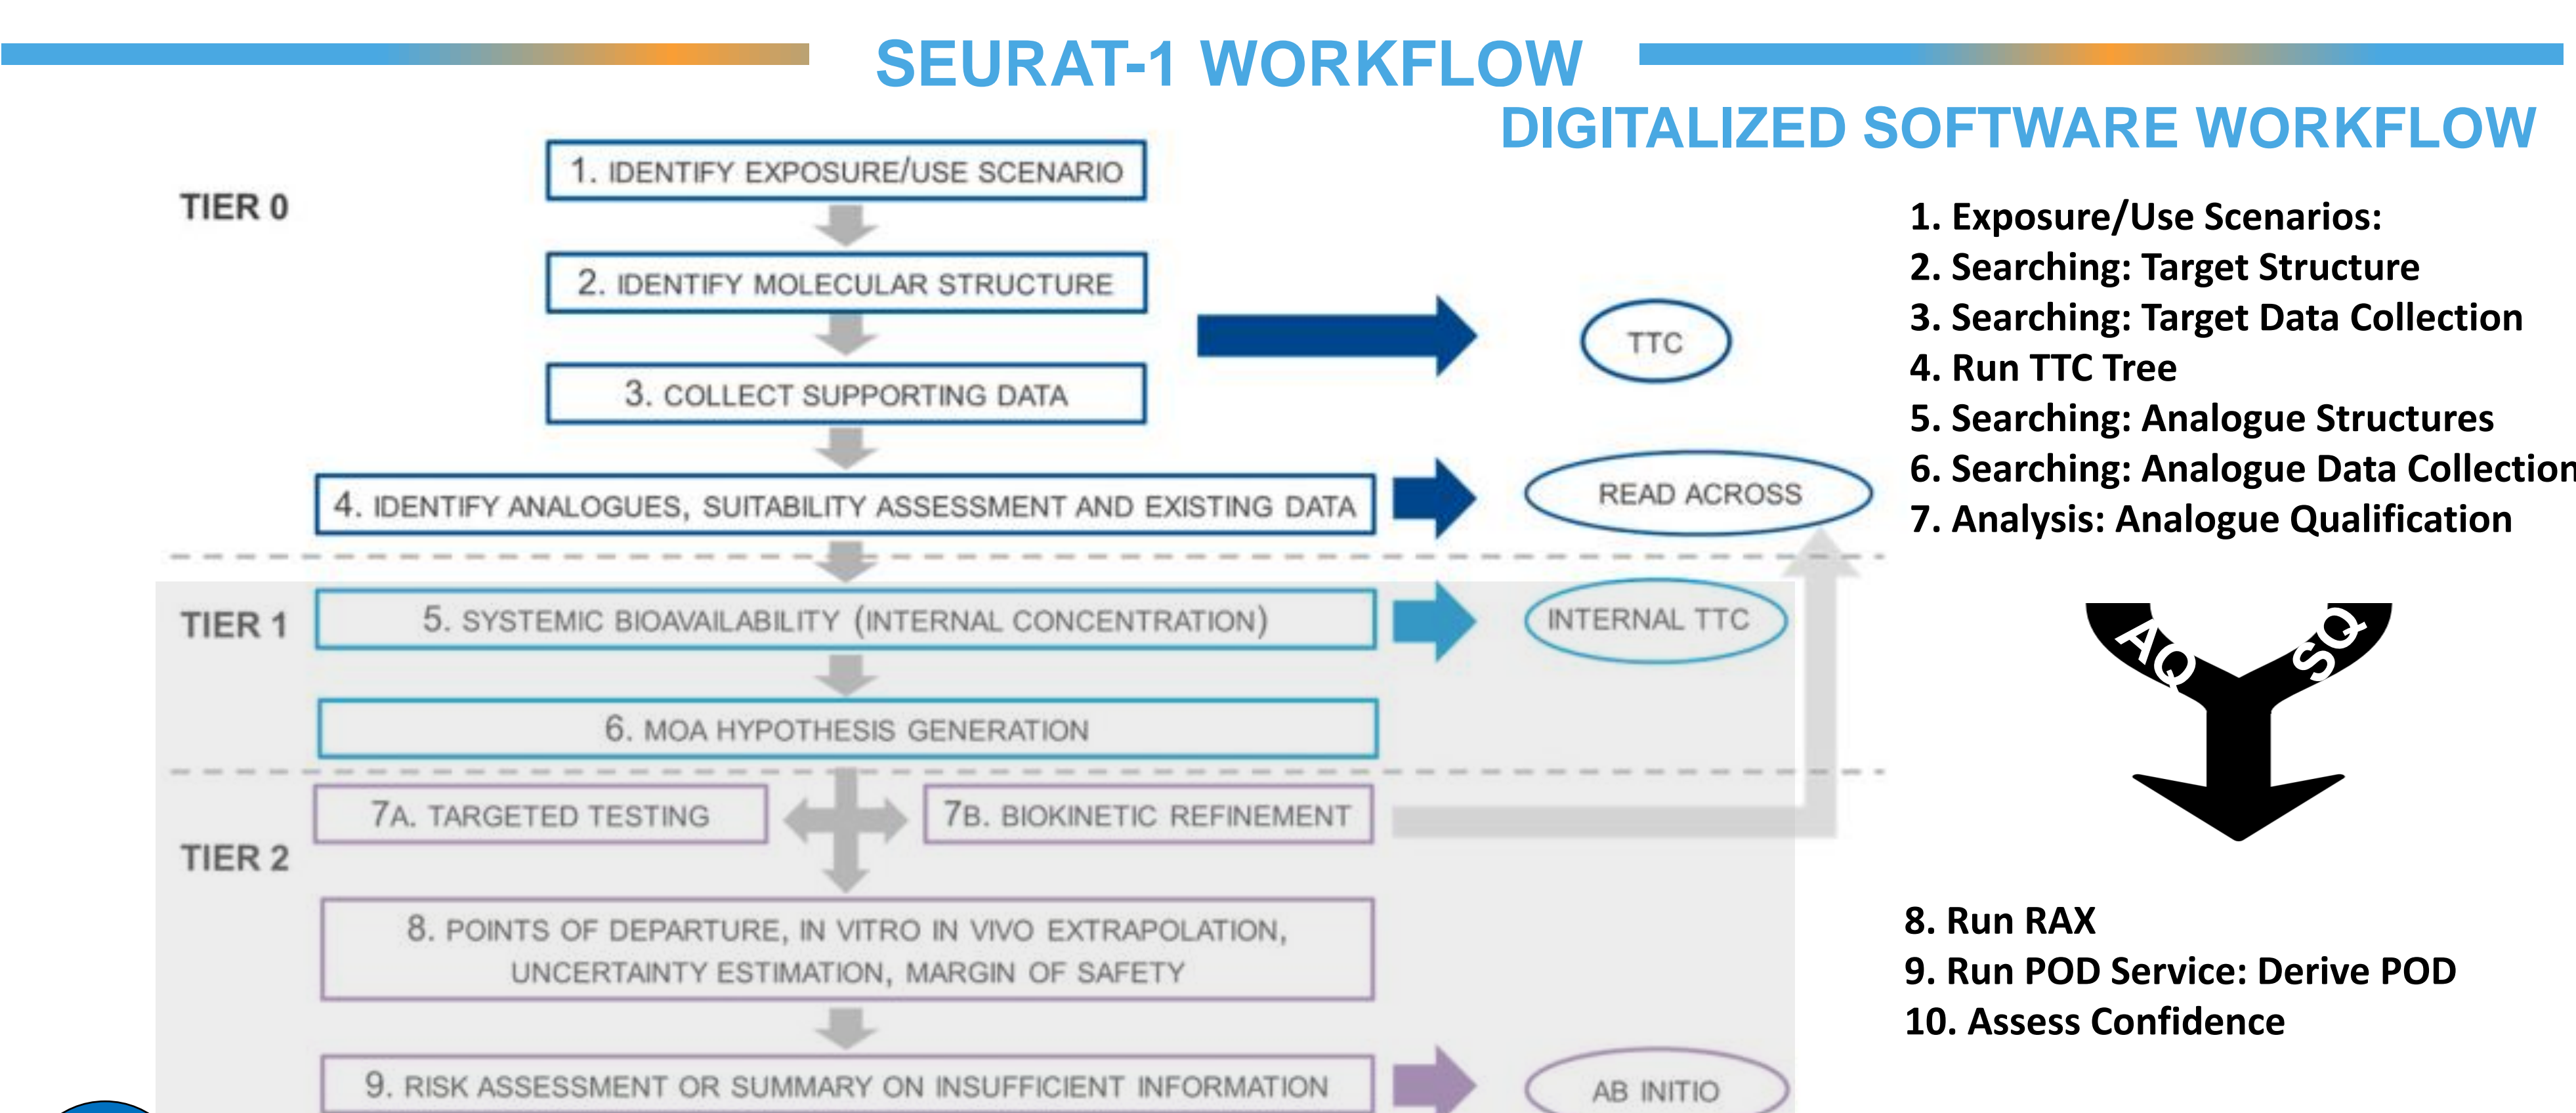

READ-ACROSS (RAX) RELIABILITY

$$RR = AQ \times SQ$$

RR uncertainty

RAX OUTCOME & UNCERTAINTY

- Classification Endpoints
- Numeric endpoints (NOAEL or EC3): 95% Confidence Interval

4 DATA USED IN THIS STUDY*

	Ames Mutagenicity	lvt chromo. aberration	In vivo micronucleus	Other genotox	Repeated Dose	Reproductive-Developmental	Endocrine Disruption Screening Assays ¹	Skin Sensitization
